

1 a.m. is obtainable by positioning the pin projecting upwards in the annular slot opposite the appropriate time on the dial.

When this **FIXED OFF** operation is not required, the pin should be removed. Similarly an additional pin is provided to obtain an early morning **FIXED ON** switching between the hours of 2.30 a.m. and 7 a.m. in half-hour steps, by positioning the screw in one of the series of tapped holes opposite the appropriate time on the dial.

This early morning **ON** switching is automatically omitted during the summer months when sunrise occurs less than approximately 20 minutes after the time set for this **ON** switching.

When this **FIXED ON** switching is not required the screw should be removed. The pin which traverses the fixed annular slot is made operative by the screw and retracts out of engagement when this screw is removed. See that all slotted pins in hands are secure after making any adjustments.

SETTING TO TIME. Turn the dial in an anti-clockwise direction until the pointer marked **TIME** indicates the correct time of day.

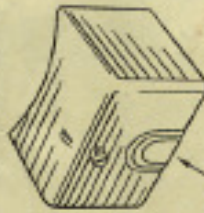

Note: Solar dials must be set to solar time. If fitted, the pointer marked **S** indicates British Summer Time and is applicable during the appropriate period of the year.

TO REMOVE DIAL. Turn dial in anti-clockwise direction until the hands are clear of switch mechanism and time pointer. Unscrew and remove nut in centre of dial, then holding the edge of the dial, ease it forward off the centre spindle

TO REPLACE DIAL. Always see that the keyway is correctly seated on clock spindle before tightening knurled nut. Finger tight is sufficient. Do not use pliers.

This switch should be protected by ensuring that the case is properly closed.

CONDUIT ENTRY

5 TO 5 CONDUIT ENTRY

The C.151 metal case can be easily converted to conduit entry if required. Ask your supplier for the extended cable cover, part No. Y26794.
